

Functional and stylish, this is the result obtained through the use of our metal mesh NEMO. NEMO wire mesh can be applied very easily and it is characterized by excellent structural qualities and by a geometrical and strict style. The mesh is rectangular with great flexibility in the longitudinal direction, while the transverse rods confer great rigidity and determines its width. This particular type of wire cloth applied to a roller system allows you to benefit from screening only when necessary and with considerable aesthetic and architectural advantages. Nemo allows you to screen any window in any weather, giving a real thermal insulation of the façade, an effective resistance to wind and possible deterioration or lacerations caused by UV rays and smog
