

The spectacular spire of Breganzona church located in Swiss and realized in glass and laminated wire mesh.

The whole project of the church has been studied by Camponovo Architetti & Associati, that in order to realize the great sovrastructure in glass and laminated wire mesh, relied on the mastery of Frener & Reifer Metallbau of Bozen and on the experience of Tessitura Tele Metalliche Rossi, who created and supplied the wire mesh Nemo. Thanks to our metal mesh the structure has:

- low solar energy storage in the baffle
- high acoustic noise reduction system
- low solar direct and total transmittance
- 100% recyclable product
