

Inside the meeting room of the Luxury Hotel AT six in Stockholm, the R&R 70x3 product was used to cover the heating elements of the room. Its transversal rigidity, due to the presence of stainless steel rods, allows for better absorption of any impacts, opposite to the longitudinal malleability which allowed the upper curvature to be able to be anchored under the windowsill. An excellent solution, which in addition to having an aesthetic appeal, also allows for greater dissipation of winter heat and summer cooling.
